Problem 1

The first problem is that navigating to the Threads is a hassle. It requires going to Settings and then to Thread subscriptions. One would think that the Subscriptions tab under Settings would take you there, but it does not. This is why in Solution1 I added the Threads. The PaperPrototype1 shows it more simply. Clicking on Threads would take you to PaperPrototype2, which solves an additional problem.

Problem 2

The second problem is that once you are in the Threads subscriptions, you are presented with a list of the threads with limited information. This means that if you forgot what each thread is about, you have to click it to see the full details and not just the name. This is why in Solution2 I replaced the list to instead include the main body of the thread. PaperPrototype2 shows more than just the name, and one can easily tell what the thread is about. Additionally, I kept the function that clicking on said thread would open the entire thread information, as is already implemented.
